--	-----------------------

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Direct Submission

                                                                                       is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Sequence Quality Assessment: This entry has been annotated with sequence quality estimates computed by the Phrap assembly program.

All manually edited bases have been reduced to quality zero. Quality levels above 40 are expected to have less than 1 error in 10,000 bp.

Base-by-base quality values are not generally visible from the GenBank flat file format but are available as part

of this entry's ASN.1 file.

all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., Phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. This sequence was finished as follows unless otherwise noted:

Sequence Validation:

₽ S

This sequence has been validated by Multiple Complete Digest fingerprinting. Comparison of the experimentally derived digest fragments with sequence-predicted fragments is given below. The electronically-digested sequence consists of both insert and vector, in order to accurately represent the entire circular BAC. Small fragments below a variable cutoff (approximately 400-800 bp) are not resolved in the fingerprint and hence do not appear in the table. There are no significant remaining discrepancies between the experimental and predicted values. Uniquely ordered fragments are separated by dashed lines.

It currently consists of 20 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            density. These genes include sequences encoding the bone sialoprotein, the matrix gla protein (MGP), osteopontin (OPN) and osteoprotegerin/osteoclastogenesis inhibitory factor (OPG/OCIF). A at this position is associated with a higher peak bone mass. Along with the other polymorphic sites, this variable sequence can be used to predict at individual's predisposition to osteoporosis and atherosclerosis, thus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence shows the polymorphic site at position 1869 of the human bone sialoprotein (BSP) gene promoter. It was used in the methods of the invention, which involve the determination of the promoter sequence at polymorphisms in a number of genes controlling bone mineral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Assessing predisposition to a calcification condition status such osteoporosis and atherosclerosis, comprising determining the geno of the promoter of the bone statoprotein, matrix gla protein,
                                          Novel therapeutic agent for prevention and treatment of calcified tumors and proliferative disorders such as osteosarcoma, multiple myeloma and breast cancer, comprises bone sialoprotein promoter
                Claim 5:
                                                                                                            WPI; 2000-442489/38.
                                                                                                                                                                                                                                                                                                                                         Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human bone sialoprotein (BSP) promoter (-2184-+237).

CC in bone, in trophoblastic cells of the placents, and in cementum and commander to the primary or at metastatic sites. This is especially evident for commander to the primary or at metastatic sites. This is especially evident for compositive metastatic to sites. This is especially evident for compositive metastatic tumours, but includes any osteotropic compositive metastatic tumour such as, for example, lung, multiple compositive metastatic cumour such as, for example, lung, multiple composition of the invention may be used to treat osteotropic composition of the invention may be used to treat osteotropic tumours commandianate growths with calcification potential) via delivery and expression of a gene encoding a protein such as herpes simplex virus composition of a gene encoding a protein such as herpes simplex virus composition for to a cytotoxic phosphorylated form. The composition may also be used to promote bone repair via delivery and expression of a gene coding a therapeutic protein such as a growth factor, a cytokine or composition in which the gene under the control of the BSP promoter is a reporter gene. Such reporter compositions may composition in which the gene under the control of the BSP promoter is a reporter gene. Such reporter compositions may content and protein such as agrowth factor. The invention content of the supressat sequence represents a human BSP promoter content is composition of the content of the fundation. The human BSP gene is located on chromosome 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel gene therapy composition comprising a mammalian bone sialoprotein (BSP) promoter operably linked to a gene sequence encoding a toxic and/or therapeutic protein contained within a delivery vector, such as a recombinant adenovirus or a liposome. The BSP promoter directs gene expression in tissue and tumour cells with calcification potential. It is active in fully-differentiated osteoblasts

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, ADS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       )

Sequence Listing;

The invention relates to a composition comprising a human GDP-mannose 4,6-dehydratase (GM4,6D) peptide. The peptide is useful for identifying GM4,6D inhibitors are useful for reducing inflammation in a mammalian subject and for treating or ameliorating diseases affected by the level of cellular fucosylation or diseases affected by the fucosylation of glycoconjugates. These diseases include arthritis, transplant rejection, asthma, sepsis, reperfusion injury, stroke or infection. The GM4,6D peptide or a polymucleotide encoding it is also useful for manufacturing complex carbohydrates and as targets for screening small molecule antagonists of the activity of the enzyme. The

New composition comprising GDP-mannose 4,6-dehydratase (GM4,6D) peptide, for manufacturing complex carbohydrates, or as targets for screening GM4,6D antagonists for treating e.g. arthritis, or transp.

                                                                                                                                               This sequence encodes a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.
                                                                                                                                                                                                                                                                                                                                                                                               New isolated Borrelia burgdorferi nucleic acids - used to develop products for the diagnosis, prevention and treatment of diseases caused by Borrelia, particularly Lyme disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (HUMA-)

                  This sequence encodes a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can albe used for detection of members of the Borrelia genus.
                                                                                                                                   New isolated Borrelia burgdorferi nucleic acids - us products for the diagnosis, prevention and treatment caused by Borrelia, particularly Lyme disease
                                                                                                                                                                                                                                                                                                                                                                                                             Borrelia burgdorferi.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschaprung's disease, Chronic colitis or ulcerative colitis. The present sequence is a genomic DNA fragment encoding a digestive system antigen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polynucleotides encoding digestive system antigens, useful for diagnosing, treating, preventing and/or prognozing disorders of the digestive system, particularly cancer and cancer metastases -

Sequences AAS31827-AAS32182 represent genomic DNA molecules, which encode the liver associated polypeptides of the invention. Liver associated polypeptides are invertible in the polypeptides and their associated polypeptides are useful in the diagnosis, treatment and prevention of various types of disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A pathological condition can be determined by detecting the presence or
                                                                                                                                                                                                                                                                                                                       Isolated nucleic acid molecule encoding a human liver related protein is used in preventing, treating or ameliorating disorders of the liver particularly cancer of the liver -

                                                                                                                 The present invention relates to the isolation of novel human connective tissue related polypeptides (AAU86435-AAU86932) and the polymucleotide (CDNA and genomic) sequences encoding them. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of diseases associated with connective tissue(s), including cancer. The polymucleotide sequences of the invention are also useful in gene therapy. ABK42102-ABK43116 represent genomic sequences encoding the novel human connective tissue related polypeptides.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fifty wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                            Nucleic acid encoding novel connective tissue associated polypeptides, used in diagnosing, preventing, treating or ameliorating a disorder such as cancer or rheumatoid arthritis -
                                                                                                                                                                                                                                                                                                                                                                     Rosen

```
The invention relates to 145 novel human liver antigens (ABP40831-CC ABP40975) and to cDNAs encoding them (ABN90180), and also cc encompasses polypeptides 90% identical and polynuclectides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human liver antigen (CC prognosing or preventing various disorders of the liver. Such conditions (c. g., cytomegalovirus, Epstein-Barr virus, cc infections (e.g., Clonorchis sinensis, Echinococcus granulosus and the mese of the patitis A virus hapatitis B virus and hepatitis C virus), parasitic infections (e.g., Clonorchis sinensis, Echinococcus granulosus and continued infections (e.g., cytomegalovirus, Epstein-Barr virus, continued instolytica), and also bacterial and fungal infections. Other disorders that may be treated include inflammatory conditions (e.g., cytomegalovirus) parasitic cirrhosis and granulomatous hepatitis), damage caused by drugs or toxins, autoimmune diseases (e.g., Milson's disease, primary biliary cirrhosis), carcinoma), portal hypertension, or gastrointestinal disorders (e.g., peptic ulcers, gastritis and peritoneal diseases). Liver antigen compounds which modulate liver antigen expression or activity. The polymeptides may be used as molecular weight markers or to compounds which modulate liver antigen expression for activity. The mapping, in the identification of individuals and in forensic analysis, and the polypeptides may be used as molecular weight markers or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. Sequences Abn90182-Abn90537 represent human liver antigen constructions and sequences antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-NOV-2000; 2000US-244617P.

                                                                                                                                                                                                                                                                              5
                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a nucleic acid comprising a sequence of 18 chases, of a segment of chemically pretreated DNA (CP DNA) e.g. with CD bisuphhite, of genes associated with tumour suppression and concogenes having a sequence taken from 536 (actually 533 since manbers 408, 458 and 500 are missing from the sequence listing) sequences (Ss) and sequences complementary to (Ss). The nucleic acid may be a complete expension of a tleast 9 nuclectides and may CC form part of a set of probes for detecting the cytosine methylation state cand/or single nuclectide polymorphisms and also to be used in an CC array for analysing diseases associated with CpG dinuclectides e.g. CC accers and tumours. The probes can also be used in a method for CC array for analysing cytosine methylations. The parameters for the diagnosis CC and/or therapy of existing diseases or the predisposition to specific and/or therapy of existing diseases or the predisposition to specific CC diseases, by analysing cytosine methylations. The parameters may be CC compared to another set of genetic and/or epigenetic parameters, the CC differences serving as basis for diagnosis and/or prognosis events which CC are disadvantageous to patients. The present sequence is one of the CC and disadvantageous to patients. The present sequence for the complementary sequence of the corresponding odd numbered sequence (e.g. CC ID 2 and ID1, ID 536 and ID 535, except for those whose partner sequence (c.g. cm partner sequence).
                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AlDs, epilepsy, neurofibromatosis, theumatoid arthritis, psoriasis and inflammatory/ulcerative bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid comprising fraction diagnosis and treatment cytosine methylation -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAX20248 to AAX20402 represent polynucleotide sequences isolated from Borrelia burgdorferi (Bb). Products derived from Bo can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borrelia belongs to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrelia causes epidemic and spirochetes are pathogenic in humans and Borrelia causes epidemic and

                                                                                                                                                                   AAX20248 to AAX20402 represent polynuclectide sequences isolated from Borrelia burgdorferi (Bb). Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borrelia belongs to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrelia causes epidemic and sendemic relapsing fever, and Lyme borreliosis, more commonly known as
                                                                                                                                                                                                                                                                                                                                              New isolated Borrelia burgdorferi nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of infections, particularly Lyme disease
